Selected Answer: D

In a hybrid cloud environment, the organization can keep their website data on-premises and then use BigQuery to analyze the data in the cloud. This allows the organization to take advantage of the scalability and performance of BigQuery without having to move all of their data to the cloud.

The assumption should be made that there is still a private network involved. Hybrid clouds always include a private cloud and are typically managed as one entity. Multi-clouds always include more than one public cloud service, which often perform different functions.
