But ChatGPT says D. Container environment is used primarily for deploying and managing applications in a lightweight and scalable way but is not focused on large-scale data analysis

scalable way but is not focused on large-scale data analysis.

It says A is correct because;

allows an organization to use different cloud services from multiple providers to store, manage, and analyze vast amounts of data. This flexibility is especially important when handling petabytes of data from various sources

Selected Answer: D

Question is about service, than it is Container. :)

D: Container Environment: While containers themselves aren't specifically for handling data analytics, they are part of an infrastructure that can efficiently manage and scale data-intensive applications across various environments. Container orchestration platforms like Kubernetes can manage containers that run big data tools and applications, providing flexibility, scalability, and efficiency. This allows for the deployment of complex applications and data processing tasks that can handle large volumes of data effectively.
