Selected Answer: B

Cloud Debugger is a feature provided by some cloud platforms to allow developers to inspect the state of a running application in real-time without affecting its performance or users. It provides tools for capturing the state of an application at any code location in real time, without stopping or slowing it down.

Selected Answer: B

You can use Cloud Debugger with any deployment of your application, including test, development, and production. The debugger adds less than 10ms to the request latency only when the application state is captured. In most cases, this is not noticeable by users.
