## EXAM CLOUD DIGITAL LEADER TOPIC 1 QUESTION 14 DISCUSSION

Actual exam question from Google's Cloud Digital Leader

Question #: 14

Topic #: 1

[\[All Cloud Digital Leader Questions\]](#)

As your organization increases its release velocity, the VM-based application upgrades take a long time to perform rolling updates due to OS boot times. You need to make the application deployments faster.  
What should your organization do?

- A. Migrate your VMs to the cloud, and add more resources to them
- B. Convert your applications into containers
- C. Increase the resources of your VMs
- D. Automate your upgrade rollouts

**Selected Answer: B**

Since the problem with the current infrastructure base on VM is with OS boot time in particular, so upgrading the workload to containers would be a right choice as then OS boot time problem is eliminated which means a faster workload execution. So, correct answer should be 'B'.

**Selected Answer: B**

To make application deployments faster and improve release velocity, your organization should consider converting the applications into containers. Containers provide a lightweight and isolated runtime environment for applications, allowing for faster deployment and scaling.

**Selected Answer: B**

Convert your VM-based application into containerized application components using containerization technologies like Docker. Containerization allows you to package the application and its dependencies into lightweight, portable containers that can be deployed consistently across different environments.

**Selected Answer: D**

When you set up an automated update, the MIG rolls out a new version of an instance template automatically to all or to a subset of the group's VMs. If you have stateful configuration, the MIG also applies any unapplied per-instance configurations to the corresponding VMs.
