EXAM CLOUD DIGITAL LEADER TOPIC 1 QUESTION 58 DISCUSSION

Actual exam question from Google's Cloud Digital Leader

Question #: 58

Topic #: 1

[\[All Cloud Digital Leader Questions\]](#)

Your organization is defining the resource hierarchy for its new application in Google Cloud. You need separate development and production environments. The production environment will be deployed in Compute Engine in two regions. Which structure should your organization choose?

- A. Create a single project for all environments. Use labels to segregate resources by environment.
- B. Create a single project for all environments. Use tags to segregate resources by environment.
- C. Create one project for the development environment and one project for the production environment.
- D. Create two projects for the development environment and two projects for the production environment (one for each region).

C is easier and you won't get less than D. I think creating one project per region wouldn't create benefit.

Selected Answer: C

The recommended structure for your organization's resource hierarchy in Google Cloud would be C. Create one project for the development environment and one project for the production environment.

This structure provides clear separation between the development and production environments, allowing for better management and control of resources. By having separate projects, you can enforce different access controls, configurations, and deployments for each environment. This ensures that changes made in the development environment do not impact the production environment.

Option A and B suggest using a single project for all environments and relying on labels or tags to segregate resources. While labels and tags can be useful for organizing and categorizing resources, they may not provide the same level of isolation and control as separate projects.

Option D suggests creating multiple projects for each environment, with separate projects for the development and production environments in each region. While this approach could work, it may introduce unnecessary complexity, especially if the two regions have similar configurations and requirements.

Selected Answer: C

The part of compute engine being in two regions is meant to confuse you. It's not relevance.

Resources can be deployed across regions irrespective of their Project ID. No need to create separate Projects Region-wise.

There is no such thing as creating a project by region... Resources are either global or regional....A project is just a 'project'... When you set up a project - where do you configure the region?
