Actual exam question from Google's Cloud Digital Leader
Question #: 71
Topic #: 1

[All Cloud Digital Leader Questions]

An organization relies on online seasonal sales for the majority of their annual revenue.
Why should the organization use App Engine for their customer app?

- A. Automatically adjusts physical inventory in real time
- B. Autoscales during peaks in demand
- C. Runs maintenance during seasonal sales
- D. Recommends the right products to customers

All of these brain dumps are copied from the one flawed original version...it's identical to others sites I have paid for.

After seeing all these horrible answers I don't get why I would pay 40$ a month for this fiasco..As for the answer it's obviously B

   I just paid for the year access to GCP Digital Leader and can't believe that the 'expert' assigning the answers is getting more wrong than me who's just started learning about cloud platforms

`Selected Answer: B`

A. Incorrect, because: Although an app could be built on App Engine to adjust physical inventory in real time, this is not a built-in feature of App Engine itself. It's rather a feature of the application built on top of it.

B. Correct, because: App Engine is designed to scale automatically in response to increases or decreases in traffic. This feature is particularly useful in the case of seasonal sales, where traffic can have significant spikes.

C. Incorrect, because: While it's possible to schedule maintenance tasks, it's not a key feature that helps in handling the high load during seasonal sales.

D. Incorrect, because: Recommending the right products to customers is a feature of personalized recommendation services, which would need to be built into the application. App Engine doesn't inherently provide such features.

Always deploy during peak hours guys

👍 ↩ 🏳 upvoted 2 times

☐ 👤 **cookieMr** 1 year, 4 months ago

`Selected Answer: B`

App Engine is a fully managed platform that automatically scales up or down based on the demand. During peak seasons when online sales are high, App Engine can handle increased traffic and ensure that the app remains responsive and available to customers.

⊟ 👤 **Jackey0117** 1 year, 9 months ago

Selected Answer: B

App Engine is a platform-as-a-service (PaaS) that allows an organization to deploy and scale their web applications automatically. It can automatically adjust the number of resources (such as servers) allocated to an application based on the amount of traffic it receives.

⊟ 👤 **Sukanya_R** 1 year, 10 months ago

App Engine is a fully managed, serverless platform for developing and hosting web applications at scale. You can choose from several popular languages, libraries, and frameworks to develop your apps, and then let App Engine take care of provisioning servers and scaling your app instances based on demand. AUTOSCALE DURING SEASONAL SALES is CRITICAL where most of revenue is earned and and this feature is supported by App Engine. While since fully managed App Engine does support maintenance but this will be during entire life cycle and there is no correlation as such to seasonal sales while maintenance during seasonal sales also supported. B fits best as the only correct answer of choice and if we can choose more than 1 then B and C could apply
